The three-dimensional structure of two redox states of cyclophilin a from Schistosoma mansoni - Evidence for redox regulation of peptidyl-prolyl cis-trans isomerase activity

Abstract: ...mice infected with Schistosoma mansoni. Given the well established interaction between cyclosporin A and the cyclophilin superfamily of peptidylprolyl cis-trans isomerases, we solved the structure of cyclophilin A from *S. mansoni* (SmCypA) by x-ray crystallography in the reduced and oxidized states...  
...C-terminal cysteines (Cys-122 and Cys-126). This is the first example of a cyclophilin containing this disulfide bridge. Parallel functional studies suggest a mechanism for regulation of SmCypA activity... ...) M-1 s(-1), and it is inhibited by cyclosporin A (IC50 of 14 +/- 4 nM). The lack of conservation of this cysteine couple within the CypA superfamily, their close proximity to the active site, and the importance of thiol groups for peptidyl-prolyl cis-trans isomerase activity render this structural feature a challenge for the development of alternative and more effective anti-schistosomiasis inhibitors and may in addition... .

**Abstract:** Background: Cyclosporin A (CsA) binds with high affinity to cyclophilin, a critical step in the molecular mechanism of action of cyclosporins, whereas cyclosporin H (Csh) has extremely low affinity for cyclophilin. Csh differs from CsA by the substitution of the L-methyl valine at position 11.... . . . on the release of preformed (histamine) and de novo synthesized inflammatory mediators (peptide leukotriene C-4) from peripheral blood basophils activated by N-formyl-methionyl-leucyl-phenylalanine (FMLP). Results: Csh (8 to 800 nmol/L) concentration-dependently inhibited histamine and leukotriene C-4 release from purified and unpurified basophils activated by FMLP, whereas CsA (8 to 800 nmol... . . . with FMLP was extremely rapid and was abolished by washing the cells (three times) before challenge. Csh (8 to 800 nmol/L) had no effect on the release of histamine caused. . . . . human polymorphonuclear leukocytes with a concentration required to inhibit binding by 50% of approximately 5.4 times 10<sup>-7</sup> mol/L, whereas BocMLP was less potent with a concentration required to...

Isolation and characterization of a cDNA corresponding to a stress-activated cyclophilin gene in *Solanum commersonii*

A cDNA clone encoding cyclophilin (Cyp), was isolated from *Solanum commersonii* by utilizing subtractive hybridization. The corresponding gene was found... ...were exposed to low temperature, abscisic acid (ABA), drought, and wounding the amount of the cyclophilin mRNA was markedly increased. In addition, the gene was shown to be responsive to salicylic acid and pathogen challenge, suggesting a role in several different stress responses in plants.

**DESCRIPTORS:**

Stress; Cyclophilin; *Solanum commersonii*; Subtractive cloning

...these data either manually and/or using de novo sequencing software can frequently be a challenge. To overcome this limitation when studying the proteome of adult *Angiostrongylus costaricensis*, a nematode with unknown genome, we have used chemical N-terminal derivatization of the tryptic peptides with 4-sulfophenyl isothiocyanate (SPITC) prior to MALDI-TOF/TOF MS. This methodology has recently been reported...

CYTOKINES IN RAT LUNG IN RESPONSE TO ANTIGEN CHALLENGE

In humans, it has been demonstrated that Th-2 type cytokines (interleukin (IL)-4 and IL-5) are highly expressed in bronchial biopsies from asthmatics. Our hypothesis is that.... .cytokine response comprising Th-2 cytokines occurs during the late airway response (LR) after antigen challenge and that a different Th-1 response (interferon (IFN)-\$gamma\$) is related to the absence of a physiological response after antigen challenge. We have tested this hypothesis in different strains of rats, Brown Norway (BN) rats are high IgE producers that develop LR and increased airway responsiveness after antigen challenge, whilst Sprague Dawley (SD) rats are low IgE producers that do not develop physiological changes following antigen challenge. We assessed the expression of cytokines in these two strains of rats using semi-quantitative.... .the rats underwent general anaesthesia and were killed either immediately or eight hours after OA challenge. The lungs were frozen in liquid nitrogen for total RNA preparation. cDNA was prepared from total RNA, and mRNA expression for IL-4, IL-5 and IFN-\$gamma\$ was assessed before and after challenge in BN and SD rats using Cyclophilin as a housekeeping gene. (Abstract shortened by UMI.)

...N, D3-100, Seattle, WA 98109, USA.

Study 2: Study finds that the effect of CypA on HIV-1 replicative ability is bimodal and both high and low CypA content limits HIV-1 replication:

"HIV-1 Gag protein interaction with cyclophilin A (CypA) is critical for viral fitness. Among the amino acid substitutions identified in Gag noncleavage sites..."

...et al., (2002) J. Biol. Chem. 277, 5952-5961) and H219P substitutions in Page 40

Untitled  
the viral CypA binding loop confer the greatest replication advantage to HIV-1. These substitutions represent polymorphic amino...

...National Cancer Institute determined "the replication advantage conferred by these substitutions was far greater in CypA-rich MT-2 and H9 cells than in Jurkat cells and peripheral blood mononuclear cells (PBM), both of which contained less CypA. High intracellular CypA content in H9 and MT-2 cells, resulting in excessive CypA levels in virions, limited wild-type HIV-1 (HIV-1 WT) replication and H219Q introduction into HIV-1 (HIV-1 H219Q), reduced CypA incorporation of HIV-1, and potentiated viral replication."

They continued, "H219Q introduction also restored the otherwise compromised replication of HIV-1 P222A in PBM, although the CypA content in HIV-1 H219Q/p222A was comparable with that in HIV-1 P222A, suggesting that H219Q affected the conformation of the CypA-binding motif, rendering HIV-1 replicative in a low CypA environment.

"Structural modeling analyses revealed that although hydrogen bonds are lost with H219Q and H219P substitutions, no significant distortion of the CypA binding loop of Gag occurred. The loop conformation of HIV-1 P222A was found highly..."

...that of HIV-1WT."

The researchers concluded, "The present data suggested that the effect of CypA on HIV-1 replicative ability is bimodal (both high and low CypA content limits HIV-1 replication), that the conformation of the CypA binding region of Gag is important for viral fitness, and that the function of CypA is to maintain the conformation."

Gatanaga and colleagues published their study in the Journal of Biological Chemistry (Altered HIV-1 Gag protein interactions with cyclophilin A (CypA) on the acquisition of H219Q and H219P substitutions in the CypA binding loop. J Biol Chem, 2006;281(2):1241-1250).

Antisense U7 snRNAs and siRNAs targeting cyclophilin A inhibit HIV-1 replication

TEXT: Antisense U7 snRNAs and siRNAs targeting cyclophilin A inhibit HIV-1 replication.

According to published research from Switzerland, "Human immunodeficiency virus 1 (HIV-1) multiplication depends on a cellular protein, cyclophilin A (CypA), that gets integrated into viral particles. Because CypA is not required for cell viability, we attempted to block its synthesis in order to..."

"For this purpose, we used antisense U7 small nuclear RNAs (snRNAs) that disturb CypA pre-mRNA splicing and short interfering RNAs (siRNAs) that target CypA mRNA for degradation," wrote S.K. Liu and coworkers.

"With dual-specificity U7 snRNAs targeting the 3' and 5' splice sites of CypA exons 3 or 4," investigators reported, "we obtained an efficient skipping of these exons and a strong reduction of CypA protein. Furthermore, short interfering RNAs targeting two segments of the CypA coding region strongly reduced CypA mRNA and protein levels."

"Upon lentiviral vector-mediated transduction, prolonged antisense effects were obtained for..."

Structure-based design of a cyclophilin-calcineurin bridging ligand.

Author Abstract: ...the immunosuppressant cyclosporin A (CsA), which inhibits the proliferation of T lymphocytes by forming a cyclophilin -CsA-calcineurin complex, was designed with the known three-dimensional structure of a cyclophilin-CSA complex. The conformational restraints in TCSA appear to be responsible for its greater affinity for cyclophilin and calcineurin relative to CsA.

Text:

It has been noted that the conformations of CsA and FK506, when bound to cyclophilin A and FK506-binding protein 12 (FKBP12), respectively, differ markedly from their unbound conformations in the solid state and in solution[3,4]. Although the conformations adopted by these ligands while they are simultaneously bound to their immunophilin...

...is capped by a type II' [beta] turn at [Sar.sup.3] and [MeLeu.sup.4]. When CsA is bound to cyclophilin A (Fig. 1)[12,13], the backbone of CsA is turned inside-out; the intramolecular...

...are absent. In light of these findings, it is evident why early efforts to prepare cyclophilin A ligands on the basis of the unbound conformation of CsA met with little success...

...interfere with binding, we chose to alter a segment that is not in contact with cyclophilin[17-19] and that can be modified without significant loss of immunosuppressive activity[20, 21...]

...2 shows the local structure of CsA residues 6 to 9 in their free and cyclophilin A-bound conformations. The relative orientations of the C[alpha]-N and C[alpha]-C...

...the oxazolidinone 2[26], which is derived from L-glutamic acid, was converted to aldehyde 4[27]. Condensation of this aldehyde with

Untitled  
D-cysteine methyl ester provided the desired heterocycle 7...

...9], and it suggest that TCsA and CsA have different conformational properties.

We compared the cyclophilin A binding affinity of TCsA to that of CsA by determining each compound's ability to inhibit the rotamase activity of cyclophilin A[29]. The affinity of TCsA [inhibition constant ( $K_{\text{sub.i}}$ ) = 2 [+ or -] 0.5 nM] for cyclophilin A is three times that of CsA for cyclophilin A ( $K_{\text{sub.i}} = 6 [+ or -] 0.5$  nM)[30, 31]. Because the L-[Ala<sup>7</sup>]-D-[Ala<sup>8</sup>] fragment of CsA makes no direct contact with cyclophilin A, it is reasonable to expect that the bicyclic fragment of TCsA also does not...

...the L-[Ala<sup>7</sup>]-D-[Ala<sup>8</sup>] region of (of CsA) of the cyclophilin A-CsA complex does not contact calcineurin, the binding data suggest that this speculation has merit. The affinity of cyclophilin A-TCsA for calcineurin ( $K_{\text{sub.i}} = 78 [+ or -] 14$  nM; inhibition of phosphatase activity[32]) is approximately two to three times that of cyclophilin A-CsA for calcineurin ( $K_{\text{sub.i}} = 198 [+ or -] 16$  nM[33]). In addition, TCsA...50% inhibition concentration ( $[IC_{\text{sub.50}}]$ ) for TCsA = 2 nM;  $[IC_{\text{sub.50}}]$  for CsA = 4 nM)[34, 35]. [NFAT activity appears to be dependent on the calcineurin-mediated dephosphorylation of...

...The collective inhibitory data from biochemical and cellular assays reveal a systematic enhancement in the cyclophilin A- and calcineurin-binding properties of TCsA relative to those of CsA. The enhancement is...

...complexity of receptor-ligand interactions in the solution phase. For example, it is a significant challenge to correctly anticipate the differential effect of the molecule restraint in TCsA on the entropy...

...L. Schreiber, Cell 70, 365 (1992); [3.] K. Wuthrich et al., Science 254, 953 (1991). [4.] W. L. Jorgensen, *ibid.*, p. 954. [5.] L. D. Zydowsky et al., Protein Sci. 1...

...Natl. Acad. Sci. U.S.A. 87, 9231 (1990)]. [31.] The binding of TCsA to cyclophilin A is better than that of all of the roughly 100 CsA analogs reported, with the exception of [(Boc)Dab][CsA<sup>sup.-8</sup>] ( $K_{\text{sub.i}} = 2.4$  nM), whose reported affinity for cyclophilin is comparable to that of TCsA [J. L. Kofron, P. Kuzmic, V. Kishore, E. Colon ...
